01 Exploratory Data Analysis (EDA)

This section establishes the structural foundation of the dataset. Understanding schema, data types, and relational design is a prerequisite to all downstream analysis.

1.1 Schema Overview | Customers Table

The customers table serves as the core identity entity across the relational model. It contains five key attributes:

Column Name	Data Type	Key Type	Description
customer_id	STRING	Primary Key	Unique per order — links to orders table
customer_unique_id	STRING	Unique Key	Persistent customer identity across orders
customer_zip_code	INT64	—	Geographic granularity for logistics analysis
customer_city	STRING	—	City-level segmentation
customer_state	STRING	—	State-level regional analysis (27 states)

1.2 Order Timing Analysis

The first analytical question explores temporal purchase patterns to inform operational scheduling and marketing budget allocation.

```
SELECT
  EXTRACT(HOUR FROM order_purchase_timestamp) AS hour_of_day,
  COUNT(*) AS total_orders
FROM `Project1.orders`
GROUP BY 1
ORDER BY 2 DESC;
```

KEY FINDING: Purchase Hour Distribution

- Active Window: Significant order volume begins at 08:00 and remains elevated until 22:00.
- Peak Hour: 16:00 (4 PM) registers the highest single-hour volume, followed closely by 11:00 (11 AM).
- Late-Night Slump: Sharp decline after midnight through 06:00 — consistent with Brazilian retail market behaviour.
- Business Action: Maximise customer support staffing between 10:00 and 17:00.
- Business Action: Increase marketing budget allocation during the 11:00–16:00 window for maximum conversion ROI.

1.3 Peak Hour Geographic Drill-Down

Geographic segmentation during the peak hour (16:00) identifies the top-performing states for targeted operational resource allocation.

```
SELECT c.customer_state, COUNT(*) AS total_orders
FROM `Project1.orders` AS o
LEFT JOIN `Project1.customers` AS c ON o.customer_id = c.customer_id
WHERE EXTRACT(HOUR FROM o.order_purchase_timestamp) = 16
GROUP BY c.customer_state
ORDER BY 2 DESC LIMIT 3;
```

SP	RJ	MG
#1 Peak Hour State	**#2 Peak Hour State**	**#3 Peak Hour State**
São Paulo — Dominant	*Rio de Janeiro*	*Minas Gerais*

02 Customer Order Behaviour: Geographic Analysis

2.1 Market Concentration & Percentage Contribution

Analysis of geographic order distribution reveals a highly concentrated market with a characteristic long-tail distribution across Brazilian states.

```
SELECT
  c.customer_state,
  COUNT(*) AS total_orders,
  ROUND(SAFE_DIVIDE(COUNT(*), SUM(COUNT(*)) OVER()) * 100, 2) AS pct_contribution
FROM `Project1.orders` AS o
LEFT JOIN `Project1.customers` AS c ON o.customer_id = c.customer_id
GROUP BY c.customer_state
ORDER BY 3 DESC;
```

GEOGRAPHIC MARKET INTELLIGENCE

- Core Market Dominance: São Paulo (SP) contributes over 40% of total order volume, representing high brand penetration and market maturity.
- The "Power Triangle": SP, RJ, and MG collectively account for the vast majority of platform revenue. Operations and marketing in these three states are critical to overall business stability.
- Strategic Opportunity: Sharp volume decline across the remaining 20+ states signals significant untapped growth potential. States such as Acre (AC) and Roraima (RR) show minimal activity — likely attributable to high shipping costs, long lead times, or low brand awareness in Northern regions.
- Expansion Recommendation: Prioritise logistics investment in Bahia (BA) and Pernambuco (PE) to bridge the Southeast-Northeast gap.

2.2 Customer Distribution by State

66.6%	33.4%	27
Southeast Share (SP/RJ/MG)	**Untapped Market**	**States Covered**
Of total customer volume	*North & Northeast regions*	*Full Brazilian federation*

The customer landscape is characterised by extreme geographic concentration in the Southeast. This delivers operational efficiency but reveals significant untapped potential in the North and Northeast. Future growth strategies should prioritise logistics expansion into BA and PE to bridge this geographic imbalance.

03 Product Category Performance

Product category analysis is foundational to warehouse strategy, SKU rationalisation, and marketing resource allocation across 70+ categories.

```
SELECT
  `product category` AS product_category,
  COUNT(*) AS total_order_quantity
FROM `Project1.orderItems` AS oi
LEFT JOIN `Project1.products` AS p ON oi.product_id = p.product_id
GROUP BY `product category`
ORDER BY 2 DESC;
```

3.1 Category Performance Segmentation Framework

Segment	Top Categories	Characterisation	Strategic Recommendation
Powerhouses	Bed/Bath/Table, Health & Beauty, Sport & Leisure, Furniture, Computer Accessories	High volume — drives majority of shipping traffic and warehouse utilisation	Prioritise inventory depth; negotiate bulk logistics rates; optimise pick-and-pack workflows
Mid-Tier Specialists	Watches/Gifts, Toys, Automotive	Higher profit margins; lower purchase frequency	Focus on upsell campaigns; bundle with Powerhouse categories where complementary
Niche / Long Tail	PC Gamer, Insurance, Fashion Children's Clothing	Minimal demand — low shelf-space ROI	Evaluate de-listing; redirect capacity to high-velocity SKUs

NOTABLE ANOMALIES & DATA QUALITY FLAGS

- Watches & Gifts (#7 overall): Unexpectedly high ranking suggests the platform is heavily used for gifting behaviour, opportunity for dedicated gifting features or seasonal promotional campaigns.
- Unclassified Orders (1,600+): A data integrity gap exists with over 1,600 orders lacking a product_category assignment. This represents a hidden trend risk requiring ETL enrichment as a priority action.
- Insurance & Services (#Last 2 orders): Zero-ROI product line. Candidate for immediate de-listing to eliminate administrative overhead and streamline category management.

04 Temporal Trends & Seasonality

4.1 Year-on-Year Revenue Growth (Delivered Orders Only)

Annual growth analysis isolates the platform's progression from pilot to stabilised operations, providing reliable context for forecasting and capacity planning.

```
SELECT
  EXTRACT(YEAR FROM o.order_purchase_timestamp) AS purchase_year,
  COUNT(DISTINCT o.order_id) AS total_orders,
  ROUND(SUM(p.payment_value), 2) AS total_revenue
FROM `Project1.orders` AS o
JOIN `Project1.payments` AS p ON o.order_id = p.order_id
WHERE o.order_status = 'delivered'
GROUP BY 1 ORDER BY 1;
```

Purchase Year	Total Delivered Orders	Total Revenue (R$)	Average Order Value (R$)
2016 (Pilot Phase)	266	$46,586	$175.14
2017 (Scale Up)	43,428	$6,922,900	$156.41
2018 (Stabilisation)	52,783	$8,452,975	$160.15

Note: 2016 reflects a partial-year pilot. The primary YoY comparison baseline is 2017–2018.

4.2 Monthly Seasonality Intelligence

MONTHLY ORDER TREND INSIGHTS (2016–2018)

- Explosive Growth: Platform transitioned from pilot in 2016 to high-volume scale in 2017, with monthly orders peaking at 7,544 in November.
- Black Friday Dominance: November 2017 shows a 63% month-over-month spike — the critical annual sales driver for the business.
- Market Maturity: By 2018 the business stabilised at 6,000–7,000 orders per month, indicating a shift from rapid acquisition to steady-state operations.
- Seasonal Dips: Consistent softening in April and May each year — a mid-year lull where targeted promotional spend would improve performance.
- Data Integrity Note: Drops in September 2016 and September 2018 are data collection artefacts (incomplete months at dataset boundaries), not actual demand crashes.

4.3 Diurnal (Time-of-Day) Purchase Behaviour

```
SELECT t1.time_of_day, COUNT(DISTINCT t1.order_id) AS total_orders
FROM (
  SELECT *,
    CASE
      WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 0  AND 6  THEN 'DAWN'
      WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 7  AND 12 THEN 'MORNING'
```

```
      WHEN EXTRACT(HOUR FROM order_purchase_timestamp) BETWEEN 13 AND 18 THEN
'AFTERNOON'
      ELSE 'NIGHT'
    END AS time_of_day
  FROM `Project1.orders`
) AS t1
GROUP BY t1.time_of_day ORDER BY 2 DESC;
```

Time Period	Hours	Total Orders	Share of Daily Volume
NIGHT	19:00 – 23:59	50,238	~50.2%
AFTERNOON	13:00 – 18:00	25,848	~25.8%
MORNING	07:00 – 12:00	~21,000	~21.0%
DAWN	00:00 – 06:00	2,848	~2.8%

05 State-Level Strategic Performance

5.1 The "Power Triangle" Southeast Dominance

41,746	12,852	11,635
Sao Paulo (SP) Orders	**Rio de Janeiro (RJ)**	**Minas Gerais (MG)**
~40% of platform volume	*Secondary hub*	*Third-largest market*

The Southeast region acts as the absolute centre of gravity for the business. São Paulo functions as both the primary consumer hub and the central logistics node. This concentration enables operational efficiency but also represents a structural concentration risk.

5.2 Temporal Heatmap Intelligence

STATE-LEVEL TEMPORAL ANALYSIS

- Mid-Year Peak Corridor: A strong demand corridor is visible in May and August, where nearly all top-performing states show intensified order volumes simultaneously.
- Q4 Surge: August (10,843 total) rivals November in several states confirming mid-to-late-year baseline growth beyond Black Friday alone.
- Regional Resilience: Bahia (BA) and Parana (PR) demonstrate remarkable consistency, maintaining high-volume performance even during Q1 fluctuations.
- Macro-Economic Synchronisation: SP, RJ, and MG show near-perfectly synchronised trend movements platform-wide campaigns have uniform regional impact in the Southeast, enabling efficient unified marketing strategies.

06 Economic Impact: Revenue & Freight Analysis

6.1 Year-on-Year Average Order Value Change (Jan–Aug, Like-for-Like)

```
WITH YearlyStats AS (
  SELECT
    EXTRACT(YEAR FROM o.order_purchase_timestamp) AS year,
    AVG(p.payment_value) AS avg_cost
  FROM `Project1.payments` AS p
  INNER JOIN `Project1.orders` AS o ON p.order_id = o.order_id
  WHERE EXTRACT(MONTH FROM o.order_purchase_timestamp) <= 8
    AND EXTRACT(YEAR  FROM o.order_purchase_timestamp) IN (2017, 2018)
  GROUP BY year
)
SELECT
  ROUND(avg_2017, 2) AS avg_2017,
  ROUND(avg_2018, 2) AS avg_2018,
  ROUND(((avg_2018 - avg_2017) / avg_2017) * 100, 2) AS pct_increase
FROM (
  SELECT
    MAX(CASE WHEN year = 2017 THEN avg_cost END) AS avg_2017,
    MAX(CASE WHEN year = 2018 THEN avg_cost END) AS avg_2018
  FROM YearlyStats
);
```

$150.43	$155.28	+$4.85
2017 Avg Order Value	**2018 Avg Order Value**	**YoY Growth**
Jan–Aug baseline	*Jan–Aug comparison*	*+3.2% — healthy, stable*

A R$4.85 average order value increase represents a structurally stable, healthy growth trajectory. In Brazil's inflationary environment during this period, pricing stability may reflect deliberate customer retention strategy rather than passive inflation pass-through.

6.2 Revenue & Average Order Price by State

State	Total Revenue (R$)	Avg. Order Price (R$)	Market Profile
SP — Sao Paulo	5,202,955	109.65	Volume leader — efficiency model
RJ — Rio de Janeiro	1,824,093	125.12	Premium volume hub
MG — Minas Gerais	1,585,308	120.75	High-frequency regional hub
RS — Rio Grande do Sul	750,304	120.34	Southern anchor
PR — Parana	683,084	119.00	High growth trajectory
PB — Paraiba	115,268	191.48	Remote premium market
AL — Alagoas	80,315	180.89	High AOV logistics constrained
RR — Roraima	7,829	150.57	Frontier minimal volume

REVENUE SEGMENTATION INTELLIGENCE

- Mass Market Hubs (SP/RJ/MG): Deliver highest absolute revenue with comparatively lower average order values (~$110–125). High customer density drives volume-based efficiency optimised for frequency and low logistics cost per order.
- "Inversion" Effect: When ranked by average order value, the ranking flips entirely. Paraiba (PB) leads at $191.48 75% higher than Sao Paulo's $109.65.
- Remote Market Premium: North/Northeast states consistently show higher average order prices. Customers use the platform for high-value specialty goods unavailable locally, justifying higher logistics friction.
- Concentration Risk: Revenue drops sharply after the Southeast hub a "top-heavy" structure representing strategic vulnerability and over-dependence on a single geographic corridor.

6.3 Freight Analysis: The Regional Cost Divide

Region	State	Avg. Freight (R$)	Cost Multiple vs Hub
Hub — Southeast	SP (Sao Paulo)	$15.15	1.0x Baseline
Efficient — South	PR (Parana)	$20.53	1.4x
Frontier — North	RR (Roraima)	$42.98	2.8x Higher
Frontier — Northeast	PB (Paraiba)	$42.72	2.8x Higher

FREIGHT INTELLIGENCE & STRATEGIC IMPERATIVE

- Hub Efficiency Advantage: Sao Paulo's low freight cost (R$15.15) directly reduces purchase completion friction — a primary driver of its dominant sales volume.
- The "Remote Tax": States like Roraima and Paraiba face shipping costs nearly 3x higher than SP. This directly explains higher AOV in these regions customers must justify freight cost with high-value purchases.
- Critical Friction Points: The entire North/Northeast corridor (MA, PI, PB, RO, AC, RR) shows average freight exceeding $38.00 — a structural barrier to customer acquisition.
- Strategic Imperative: Regional fulfillment centres in PE or PA would convert long-haul, high-cost shipments into local deliveries, potentially unlocking 33% of the untapped national customer base.

07 Delivery Performance & Logistics Intelligence

7.1 Overall Delivery Performance Assessment

```
SELECT
  CASE
    WHEN DATE_DIFF(DATE(order_estimated_delivery_date),
                   DATE(order_delivered_customer_date), DAY) > 0 THEN 'BEFORE TIME'
    WHEN DATE_DIFF(DATE(order_estimated_delivery_date),
                   DATE(order_delivered_customer_date), DAY) = 0 THEN 'ON TIME'
    ELSE 'LATE'
  END AS delivery_performance,
  COUNT(*) AS total,
  ROUND(COUNT(*) * 100 / SUM(COUNT(*)) OVER(), 2) AS pct_of_total
FROM `Project1.orders`
WHERE order_status = 'delivered'
  AND order_estimated_delivery_date IS NOT NULL
  AND order_delivered_customer_date IS NOT NULL
GROUP BY 1 ORDER BY 3 DESC;
```

Delivery Status	Total Orders	Percentage	Assessment
BEFORE TIME	88,644	91.89%	Excellent — exceeds SLA commitment
LATE	6,534	6.77%	Risk Zone — geographic investigation required
ON TIME	1,292	1.34%	Met SLA — exactly as promised

The platform maintains a 93.23% combined success rate (Before Time + On Time), driven by a conservative estimation strategy. The 6.77% failure rate represents 6,500+ orders requiring geographic segmentation to confirm if North/Northeast long-haul routes are the primary failure driver.

7.2 Delivery Speed Distribution

```
SELECT
  CASE
    WHEN DATE_DIFF(order_delivered_customer_date, order_purchase_timestamp, DAY) <= 7
      THEN 'Fast (Under 1 Week)'
    WHEN DATE_DIFF(order_delivered_customer_date, order_purchase_timestamp, DAY) <= 15
      THEN 'Standard (1-2 Weeks)'
    WHEN DATE_DIFF(order_delivered_customer_date, order_purchase_timestamp, DAY) <= 30
      THEN 'Slow (2-4 Weeks)'
    ELSE 'Critical (30+ Days)'
  END AS delivery_speed_segment,
  COUNT(order_id) AS order_count,
  ROUND(COUNT(order_id) * 100 / SUM(COUNT(order_id)) OVER(), 2) AS pct_of_total
FROM `Project1.orders`
WHERE order_status = 'delivered' AND order_delivered_customer_date IS NOT NULL
GROUP BY 1 ORDER BY 2 DESC;
```

LOGISTICS HEALTH ASSESSMENT

- Core Performance: Over 75% of orders are delivered within 14 days primary logistics hubs serve the Southeast and South regions efficiently.
- "Friction Quarter": ~1 in 4 customers waits more than 15 days. Based on geographic analysis, these "Slow" and "Critical" segments correlate directly with high-freight North/Northeast regions.
- Operational Risk: The 4.27% Critical Rate (30+ days) represents a meaningful customer churn risk. Reducing this "long tail" should be classified as a top operational priority to protect Net Promoter Score (NPS).

7.3 The "Under-Promise, Over-Deliver" Regional Paradox

State	Region	Days Delivered Early vs Estimate	Actual Avg Delivery (Days)
AC — Acre	North (Amazon)	21.0 days early	~24 days
RO — Rondonia	North (Amazon)	20.0 days early	~26 days
AP — Amapa	North (Amazon)	20.0 days early	~27 days
AM — Amazonas	North (Amazon)	20.0 days early	~26 days
RR — Roraima	North (Amazon)	17.0 days early	~29 days

These five states are simultaneously the slowest in absolute delivery time AND the highest in "days before estimate." The system assigns extremely conservative estimates to protect against unpredictable Amazonian logistics (seasonal rains, river transport delays, road closures). A customer in Acre receiving their package 21 days ahead of estimate has a stronger satisfaction response than a customer in Sao Paulo receiving 3 days early — despite objectively slower delivery.

ACTIONABLE OPPORTUNITY

- The platform can safely reduce estimated delivery windows for North/Amazon states by 7–10 days without increasing the failure rate.
- A tighter delivery promise makes the platform more competitive in these regions and would reduce cart abandonment driven by discouraging estimated delivery dates.
- Strategic Win: This change requires no logistics investment — only an adjustment to the estimation algorithm for relevant state codes.

08 Payment Ecosystem Analysis

8.1 Month-on-Month Payment Type Distribution

```
SELECT
  EXTRACT(MONTH FROM o.order_purchase_timestamp) AS month,
  p.payment_type,
  COUNT(*) AS total_transactions
FROM `Project1.payments` AS p
LEFT JOIN `Project1.orders` AS o ON p.order_id = o.order_id
GROUP BY p.payment_type, month
ORDER BY month, 3 DESC;
```

PAYMENT ECOSYSTEM INTELLIGENCE

- Market Preference: Platform heavily dependent on Credit Card (~75% of transactions). Marketing strategies should prioritise credit-based promotions and installment incentives.
- Alternative Growth — Boleto/Pix: Consistent ~20% market share. Frictionless checkout for non-credit users is essential to retaining this segment.
- Universal Credit: Credit card is the #1 payment method across all 27 states — from industrial SP to remote Amazon regions. No regional payment preference divergence exists.
- Strategic Focus: Invest in bank partnership incentives for credit promotions rather than diversifying into niche regional payment methods.
- Data Anomaly: September–December volume decline requires pipeline investigation before attributing to market contraction.

8.2 Installment Behaviour Analysis

Installments	Total Orders	Market Share	Consumer Profile
1 (Full Payment)	52,546	~52.3%	Cash/Debit — high liquidity or low-cost items
2 – 4 months	29,972	~29.8%	Mid-tier shoppers — stretching a medium purchase
5 – 10 months	19,399	~17.3%	High-ticket shoppers — electronics/appliances
11 – 24 months	350	~0.3%	Premium financed — rare high-value luxury goods
0 (Anomaly)	2	<0.01%	Data error — exclude from analysis

INSTALLMENT BEHAVIOURAL INSIGHTS

- "Interest-Free" Threshold Effect: Volume spikes at 8 and 10 installments — a clear signal of bank-offered "Sem Juros" promotions. The platform's sweet spot for high-value sales is exactly 10 months.

- Drop-Off After 10: Orders collapse from 5,328 at 10 installments to just 23 at 11. Brazilian credit infrastructure caps interest-free deals at 10 months, making 11+ commercially unattractive to consumers.
- Recommendation: Maintaining 10-month interest-free credit partnerships is critical. Nearly half of platform volume relies on credit installments — loss of these terms would materially impact revenue.

09 Advanced Analytics & Data Quality Audit

9.1 Structured Data Health Score

Beyond simple null checks, this analysis calculates a structured data health score across critical columns — providing a quantified measure of dataset reliability for downstream analytical consumption.

```
SELECT
  column_name,
  COUNT(1) AS total_rows,
  COUNTIF(field_value IS NULL) AS null_count,
  ROUND(COUNTIF(field_value IS NULL) / COUNT(1) * 100, 2) AS null_pct
FROM `Project1.orders`
CROSS JOIN UNNEST([
  STRUCT('order_id'       AS column_name, CAST(order_id AS STRING) AS field_value),
  STRUCT('order_status'   AS column_name, order_status),
  STRUCT('delivered_date' AS column_name, CAST(order_delivered_customer_date AS STRING))
])
GROUP BY 1;
```

DATA QUALITY FINDINGS

- Identifier Reliability: 100% population rate on order_id and customer_id ensures all relational joins across the 100K+ dataset are accurate and leak-free.
- Delivery Gap: 2.98% of orders lack a final delivery timestamp — confirmed as cancelled or in-transit orders, within acceptable thresholds for high-volume retail.
- Data Quality Verdict: The dataset is sufficiently clean for analytical purposes. The documented null margin does not materially skew logistics KPIs.

9.2 Cumulative Market Share — Window Function Analysis

```
-- Advanced Window Function: Running cumulative market share by state
SELECT
  customer_state,
  customer_count,
  ROUND(
    SUM(customer_count) OVER(ORDER BY customer_count DESC) /
    SUM(customer_count) OVER() * 100, 2
  ) AS cumulative_market_share_pct
FROM (
  SELECT customer_state, COUNT(customer_unique_id) AS customer_count
  FROM `Project1.customers`
  GROUP BY 1
)
ORDER BY customer_count DESC;
```

PARETO ANALYSIS — MARKET CONCENTRATION

- The "Vital Few": Customer distribution follows a strict Pareto pattern. SP (42%) combined with RJ and MG represents two-thirds of all revenue potential.
- 80/20 Rule in Action: 80.8% market coverage is achieved by serving just 6 of 27 states. The South-Southeast corridor is the only region operating at mature scale.

- "Long Tail" Challenge: The bottom 15 states combined contribute less than 6% of total volume — confirming that shipping costs and delivery times in North/Northeast act as structural entry barriers.

9.3 Regional Payment Dominance — RANK() Window Analysis

```
-- Identify the #1 payment method per state for regional marketing targeting
WITH StatePaymentVolumes AS (
  SELECT
    c.customer_state,
    p.payment_type,
    COUNT(p.order_id) AS transaction_count,
    RANK() OVER(PARTITION BY c.customer_state ORDER BY COUNT(p.order_id) DESC) AS
local_rank
  FROM `Project1.payments` AS p
  JOIN `Project1.orders`    AS o ON p.order_id = o.order_id
  JOIN `Project1.customers` AS c ON o.customer_id = c.customer_id
  GROUP BY 1, 2
)
SELECT customer_state, payment_type, transaction_count
FROM StatePaymentVolumes
WHERE local_rank = 1
ORDER BY transaction_count DESC;
```

Result confirms universal credit card dominance across all 27 states. In Sao Paulo alone, credit card transactions exceed 32,000 — higher than the bottom 20 states combined. Payment infrastructure must be optimised for high-concurrency credit processing in the Southeast.

10 Strategic Recommendations

The following recommendations are derived directly from quantitative findings across all eight analytical domains. Each is assigned a priority tier with a measurable success metric.

Priority	Recommendation	Business Impact	Success Metric
P1 Critical	Establish regional fulfillment centres in PE or PA	Reduce North/Northeast freight from $42+ to <$20 — unlocking 33% untapped customer base	Avg. freight cost in target states
P1 Critical	Resolve 1,600+ unclassified orders in product_category field via ETL enrichment	Eliminate data integrity gap hiding trend signals in product performance analysis	Null rate in product_category < 0.1%
P2 High	Reduce estimated delivery windows for North/Amazon states by 7–10 days	More competitive shipping offer; reduced cart abandonment — zero logistics investment required	Cart abandonment rate in AC, RR, AP, AM
P2 High	Launch targeted mid-year promotional campaigns to counteract April–May demand softening	Counteract consistent seasonal dip with planned marketing spend	MoM order volume Apr–May period
P3 Medium	Protect 10-month interest-free credit installment partnerships with major banks	Sustain high-ticket sales volume (AOV $155+) in 5–10 installment segment	Orders at 8–10 installment range
P3 Medium	De-list Insurance & Services category; reallocate warehouse and admin capacity	Eliminate zero-ROI administrative overhead from the product catalogue	Operational cost reduction per category
P4 Low	Pilot free shipping promotions in SP, PR, MG (avg. freight < R$21)	Low-cost conversion lever in highest-volume markets with minimal margin impact	Conversion rate lift in target states

About the Analyst

Shital Rewanwar | Data Analyst | Data Science Instructor

With over 7 years of experience and 1,500+ technical sessions delivered globally, specialisation in transforming complex datasets into strategic business narratives. This project reflects a dual focus: technical precision in SQL and BigQuery, combined with the high-level insights and business recommendation.

Education: Master of Computer Science, Data Science & Machine Learning Major
Certification: Microsoft Certified Power BI Data Analytics Associate (PL-300)
